# Asset Management Made Easier.

## What is Asset Management?

Asset management are a suite of software, designed to quickly and effectively gather all your assets from computers to lightbulbs to robots into a powerful centralised system for you to make informed decisions about your physical inventory.

Asset management is critical in any organisation to ensure assets are maintained, accounted for and maximised to their full potential. A recent study revealed companies tend to spend nearly 35% more on hardware than what they need because there's no real tracking and references.

Assets from an accounting standpoint, tend to have a steady depreciation year by year and keeping unused assets due to lack of visibility is a direct loss for any business. Besides that, having a good asset management allows you to plan maintenance, easily locate where they are, track who uses them, gather insightful statistics on its actual effectiveness / usage and start saving money by making informed decisions on your assets.

# Benefits of Asset Management

## Keep track of all your assets

Asset management software can tell where the assets are located, how they are used, and when changes were made to them. Data from the asset management solution can ensure that asset recovery will lead to better returns.

## Manage your assets accurately and effectively

Manage assets from different locations in an accurate and effective manner. Create an inventory report that may be required by insurers or lease financiers.

## Know your financial statements

Regular assessment of assets will ensure that the financial statements of the business are accurate. An asset management system removes ghost assets from your records and therefore, contributing to the bottom line.

## Automate your asset recovery

Asset recovery is automatically reflected in an asset management system. Once assets are scrapped or sold, the said assets will be removed from the records. Related assets, such as consumables and spare parts, are written off or sold to free storage space.

## Easier asset maintenance

With the insights into the performance of your equipment, negotiating with suppliers to get a reliable quotation for maintenance is easier as they will know how much maintenance needs to be performed.

## Understand the capabilities and worth of your asset

Asset management allows an organisation to understand the capabilities of its assets and their worth and how they can be operated in the most effective manner to prevent under maintenance or over maintenance problems.

## Reduce theft incidents

With the use of asset management system, incidents of thefts are lowered. Proper accounting of the asset recovery process will ensure that an organisation maximises the returns with no items lost during the process.

## Manage software licences easily

IT asset discovery informs you of what is connected to the network and, coupled with a complete inventory of hardware, software data, results in enhanced security and financial control over IT assets. Knowing the number of licences owned versus the licences deployed prevents organisations from over deploying or under deploying software, both of which can be costly.

# Why you should invest in AstiosAM Solution?

The entire life cycle of an asset from acquisition and commissioning through deployment and maintenance, to decommissioning and replacement is considered. Location and status are kept updated in order to produce management reports on status, condition and location as and when needed.

In a nutshell, an asset management system not only makes you aware of what assets you have but helps you avoid potential risks, it optimises the life cycle of your assets. With asset tracking you can put plans in place to avoid costly pitfalls so that your organisation can excel.
